Abstract. The first and second Zagreb indices were introduced more than forty years ago and are defined as the sum of squares of the degree of the vertices and the sum of the product of the degrees of the pairs of adjacent vertices. In this work, we study the first and second Zagreb indices of new operations of different subdivisions graphs related to joining of graphs.

1. Introduction

Let $G$ be a simple graph without directed edges and the vertex and edge sets of $G$ are represented by $V(G)$ and $E(G)$ respectively. The degree of a vertex $v$ in $G$ is the number of edges incident to $v$ and denoted by $d_G(v)$. Throughout this paper, we consider only simple and connected graphs. Let $\Sigma$ denotes the collection of all graphs. A mapping $T : \Sigma \rightarrow \mathbb{R}$ is called a topological index, if for every graph $H$ isomorphic to $G$, $T(G) = T(H)$. In chemical graph theory, different topological indices have different applications in isomer discrimination, QSAR/QSPR investigation, pharmaceutical drug design and many more. There are various important classes of topological indices that are extensively studied by a number of researchers. Among these topological indices, the first and second Zagreb indices were most studied and have good applications in molecular graph theory. These indices were introduced by Gutman and Trinajstić [1] in a paper in 1972 to study the structure-dependency of the total $\pi$-electron energy($\epsilon$) and are respectively defined as

$$M_1(G) = \sum_{v \in V(G)} d_G(v)^2 = \sum_{uv \in E(G)} [d_G(u) + d_G(v)]$$

Inspired by the work of X. Liu et al. \([8]\) and P. Liu et al. \([9]\), in this work we propose two types of four new operations on graphs based on join of graphs related to various subdivision graphs \(S(G), R(G), Q(G), T(G)\) and study their first and second Zagreb indices. For this purpose we first define some related graph operations and terminologies.

**Definition 1.1.** The join of two graphs \(G_1\) and \(G_2\), denoted by \(G_1 \vee G_2\), is the union \(G_1 \cup G_2\) together with all the edges joining \(V(G_1)\) and \(V(G_2)\), so that
\[
d_{G_1 \vee G_2}(v) = \begin{cases} 
  d_{G_1}(v) + n_2, & \text{if } v \in V(G_1) \\
  d_{G_2}(v) + n_1, & \text{if } v \in V(G_2).
\end{cases}
\]

The line graph \(L(G)\) is the graph whose vertices correspond to the edges of \(G\) with two vertices being adjacent if and only if the corresponding edges in \(G\) have a vertex in common.

For a connected graph \(G\), there are four subdivision related graphs, denoted by \(S(G), R(G), Q(G)\) and \(T(G)\), which is defined as follows \([10, 11, 12]\):

- \(S(G)\) is the graph which is obtained from \(G\) by adding an extra vertex into each edge of \(G\). In other words replaced each edge of \(G\) by a path of length 2.
- The graph \(R(G)\) is obtained from \(G\) by inserting an additional vertex into each edge of \(G\) and joining each additional vertex to the end vertices of the corresponding edge of \(G\).
- \(Q(G)\) is a graph derived from \(G\) by adding a new vertex to each edge of \(G\), then joining each new vertex to the end vertices of the corresponding edge of \(G\).
- The total graph \(T(G)\) is derive from \(G\) by adding a new vertex to each edge of \(G\), then joining each new vertex to the end vertices of the corresponding edge and joining with edges those pairs of new vertices on adjacent edges of \(G\).

Let \(F = \{S, R, Q, T\}\) and \(I(G)\) denotes the set of vertices \(F(G)\) which are inserted into each edge of \(G\), so that \(V(F(G)) = V(G) \cup I(G)\). Based on Cartesian product of graphs, Eliasi and Taeri \([13]\), introduced F-sum graphs of two connected graphs \(G_1\) and \(G_2\). Deng et al. in \([14]\), studied these F-sum graphs for the first and second Zagreb indices. De in \([15]\), studied the these four operations for F-index of graphs. Sarala et al. in \([10]\), introduced another four new operations related to lexicographic product and found their first and second Zagreb indices. Here we now introduce two types of four new operations on these graphs based on the join of two connected graphs \(G_1\) and \(G_2\), which are defined as follows

**Definition 1.2.** The vertex F-join graph of \(G_1\) and \(G_2\) is a graph with vertex set \(V(F(G_1)) \cup V(G_2)\) and edge set \(E(G_1) \cup E(G_2) \cup \{uv : u \in V(G_1), v \in V(G_2)\}\) that is \(G_1 \tilde{\vee} F(G_2)\) is obtained from \(F(G_1)\) and \(G_2\) by joining each vertex of \(G_1\) with every vertex of \(G_2\).
Definition 1.3. The edge F-join graph of $G_1$ and $G_2$ is a graph with vertex set $V(F(G_1)) \cup V(G_2)$ and edge set $E(G_1) \cup E(G_2) \cup \{uv : u \in I(G_1), v \in V(G_2)\}$ that is $G_1 \vee_{F} G_2$ is obtained from $F(G_1)$ and $G_2$ by joining each vertex of $I(G_1)$ with every vertex of $G_2$.

The figure of vertex F-join and edge F-join of graphs are shown in figure 1 and figure 2. In this work, we will study the first and second Zagreb indices of vertex and edge F-join of graphs respectively.

2. Main Results

In this work, we use the following topological indices to express first and second Zagreb indices of different vertex and edge F-join of graphs and hence we first define them. The Zagreb indices of a line graph is called the reformulated Zagreb indices, which are introduced by Milčević et al. \cite{16} in 2004 and are defined as

$$EM_1(G) = \sum_{e \in E(G)} d(e)^2 = \sum_{u,v \in E(G)} [d_G(u) + d_G(v) - 2]^2,$$

$$EM_2(G) = \sum_{e \sim f \in E(G)} d(e)d(f)$$

where $e \sim f$ means that the edges $e$ and $f$ share a common vertex in $G$. Different mathematical properties and applications of reformulated Zagreb indices have been studied in \cite{17, 18, 19, 20, 21}.

The F-index or the “forgotten topological index” was introduced in \cite{1} and Furtula and Gutman investigated this index again in \cite{22}. There are some other recent study of this index also \cite{23, 24, 25, 26}. The F-index of a graph $G$ is defined as

$$F(G) = \sum_{v \in V(G)} d_G(v)^3 = \sum_{u,v \in E(G)} [d_G(u)^2 + d_G(v)^2].$$

Another version of Zagreb index, named as hyper Zagreb index, was introduced by Shirredel et al. in \cite{27} and is defined as

$$HM(G) = \sum_{uv \in E(G)} [d_G(u) + d_G(v)]^2.$$

We refer the reader to \cite{28, 29, 30, 31, 32}, for some recent study and application of hyper Zagreb index.

Let $G_1 = (V(G_1), E(G_1))$ and $G_2 = (V(G_2), E(G_2))$ be two connected graphs so that $|V(G_1)| = n_1$, $|V(G_2)| = n_2$ and $|E(G_1)| = m_1$, $|E(G_2)| = m_2$ respectively. In the following first we derive the first and second Zagreb indices of vertex F-join of graphs and then edge F-join of graphs respectively where $F = \{S, R, Q, T\}$. Note that, as usual, $P_n$ denotes a path with $n$ vertices and $(n-1)$ edges whereas $C_n$ ($n \geq 3$) denotes a cycle graph with $n$ vertices.
2.1. Vertex F-join of Graphs. In this section, we derive the explicit expression of F-join of graphs where \( F = \{ S, R, Q, T \} \) respectively. At first, we consider vertex S-join of graphs.

**Definition 2.1.** The vertex S-join of two vertex disjoint graphs \( G_1 \) and \( G_2 \) denoted by \( G_1 \dot{\vee} S G_2 \) and is obtained from \( S(G_1) \) and \( G_2 \) by joining each vertex of \( V(G_1) \) with every vertex of \( G_2 \).

The degree of the vertices of vertex S-join graph are

\[
d_{G_1 \dot{\vee} S G_2}(v) = \begin{cases} 
  d_{G_1}(v) + n_2, & \text{if } v \in V(G_1) \\
  d_{G_2}(v) + n_1, & \text{if } v \in V(G_2) \\
  2, & \text{if } v \in I(G_1).
\end{cases}
\]

**Theorem 2.1.** If \( G_1 \) and \( G_2 \) be two connected graph then

\[
M_1(G_1 \dot{\vee} S G_2) = M_1(G_1) + M_1(G_2) + 4n_2m_1 + 4n_1m_2 + n_1^2n_2 + n_1n_2^2 + 4m_1.
\]

**Proof.** From definition of first Zagreb index, we have

\[
\begin{align*}
M_1(G_1 \dot{\vee} S G_2) & = \sum_{v \in V(G_1 \dot{\vee} S G_2)} d_{G_1 \dot{\vee} S G_2}(v)^2 \\
& = \sum_{v \in V(G_1)} d_{G_1 \dot{\vee} S G_2}(v)^2 + \sum_{v \in V(G_2)} d_{G_1 \dot{\vee} S G_2}(v)^2 \\
& \quad + \sum_{v \in I(G_1)} d_{G_1 \dot{\vee} S G_2}(v)^2 \\
& = \sum_{v \in V(G_1)} (d_{G_1}(v) + n_2)^2 + \sum_{v \in V(G_2)} (d_{G_2}(v) + n_1)^2 + \sum_{v \in I(G_1)} 2^2 \\
& = \sum_{v \in V(G_1)} [d_{G_1}(v)^2 + 2n_2d_{G_1}(v) + n_2^2] \\
& \quad + \sum_{v \in V(G_2)} [d_{G_2}(v)^2 + 2n_1d_{G_2}(v) + n_1^2] + \sum_{v \in I(G_1)} 2^2 \\
& = \sum_{v \in V(G_1)} d_{G_1}(v)^2 + 2n_2 \sum_{v \in V(G_1)} d_{G_1}(v) + n_1^2 \sum_{v \in V(G_2)} d_{G_2}(v)^2 \\
& \quad + 2n_1 \sum_{v \in V(G_2)} d_{G_2}(v) + n_2n_1^2 + 4m_1 \\
& = M_1(G_1) + M_1(G_2) + 4n_2m_1 + 4n_1m_2 + n_1^2n_2 + 4m_1.
\end{align*}
\]

Which is the desired result. □
Example 2.1. Using theorem 2.1, we get

\( (i) \ M_1(P_n \circ P_m) = 4n + mn(m + n + 8) - 16, \)
\( (ii) \ M_1(P_n \circ S_m) = 8n(m + 1) + mn(m + n) - 10, \)
\( (iii) \ M_1(C_n \circ S_m) = 8n + 4m + mn(m + n + 8), \)

Theorem 2.2. If \( G_1 \) and \( G_2 \) be two connected graph then

\[ M_2(G_1 \circ S G_2) = 2M_1(G_1) + n_1M_1(G_2) + M_2(G_2) + 4m_1(m_2 + n_2) \]
\[ + 2n_1n_2(m_1 + m_2) + n_1^2(m_2 + n_2^2). \]

Proof. By definition of second Zagreb index, we have

\[

\[ = \sum_{uv \in E(S(G_1))} (d_{G_1}(u) + n_2).2
\]
\[ + \sum_{uv \in E(G_2)} (d_{G_2}(u) + n_1)(d_{G_2}(v) + n_1)

\]
\[ = \sum_{v \in V(G_1)} (d_{G_1}(v) + n_2).2d_{G_1}(v)
\]
\[ + \sum_{uv \in E(G_2)} [d_{G_2}(u)d_{G_2}(v) + n_1(d_{G_2}(u) + d_{G_2}(v)) + n_1^2]
+ \sum_{u \in V(G_1)} \sum_{v \in V(G_2)} [d_{G_1}(u)d_{G_2}(v) + n_1d_{G_1}(u) + n_2d_{G_2}(v)
+ n_1n_2]. \]
\[
= 2 \sum_{v \in V(G_1)} \left( \sum_{e \in E(G_2)} d_{G_1}(v)^2 \right) + 2n_2 \sum_{v \in V(G_1)} d_{G_1}(v) \\

Example 2.16. From theorem 2.16, we get
\[ (i) \ M_2(P_n \vee P_m) = (m + 2)^2(2n - 3) + (n - 1)^2(m^2 + m - 1) + 2m(m - 1)(n - 1) + 4mn^2 - (n - 1)(2 + m)^2 + 14mn - 28m + 46n - 114, \quad n \geq 4, \ m \geq 3, \]
\[ (ii) \ M_2(P_n \vee T P_m) = (m + 2)^2(2n - 3) + m(n - 1)^2(m + 1) + 2m^2(n - 1) - (m + 2)^2(n - 1) + 2m(n - 1)(2n - 3) + 24mn - 34m + 60n - 124, \quad n \geq 4, \ m \geq 3, \]
\[ (iii) \ M_2(C_n \vee T C_m) = mn^2(m + 1) + n(m + 2)^2 + 2mn(m + 2) + 24mn + 4m + 60n, \quad m, n \geq 3, \]
\[ (iv) \ M_2(C_n \vee T P_m) = n^2(m^2 + m - 1) + n(m + 2)^2 + 2mn(m - 1 + 2n) + 24mn + 4m + 46n - 8, \quad m \geq 4, \ n \geq 3. \]

3. Conclusions

In this paper, we derived some closed formula of the first and second Zagreb index of graphs based on new operations related to the vertex and edge F-join of graphs in terms of different topological indices of their factor graphs. Also, we apply our results to compute the first and second Zagreb index for some important classes of graphs. For further study, some other topological indices for this graph operations can be computed.
